

CALCULATOR – PYTHON PROJECT

README

1. PROJECT DESCRIPTION

This project is a simple calculator developed using Python. It allows the user to perform basic mathematical operations quickly and easily.

2. FEATURES

- Addition
- Subtraction
- Multiplication
- Division
- Simple and easy-to-use interface
- Handles basic user input and calculations

3. REQUIREMENTS

Python 3.x. No external libraries are required for a basic command-line version.

4. HOW TO RUN

1. Install Python 3.x on your computer.
2. Save the calculator program as **calculator.py**.
3. Open a terminal or command prompt in the project folder.
4. Run the program using:

```
python calculator.py
```

5. Follow the instructions shown by the program and enter the required numbers and operation.

5. HOW IT WORKS

The calculator takes numbers and an arithmetic operation as input. It then performs the selected calculation and displays the result.

```
Number 1: 10  
Operation: +  
Number 2: 5  
Result: 15
```

6. PROJECT OBJECTIVE

The main objective of this project is to create a basic calculator while practicing Python fundamentals such as variables, input, operators, conditional statements, functions, and error handling.

7. FUTURE IMPROVEMENTS

- Percentage calculations

- Square root and power operations
- Scientific calculator functions
- Calculation history
- A graphical user interface (GUI)

8. CONCLUSION

This calculator project is a beginner-friendly Python application that demonstrates the use of fundamental programming concepts to solve a real-world problem.
